Introduction to Laser System Modeling using SHaRE
2 – 4 November 2021

SHaRE is a collection of library functions used to calculate the beam metrics and irradiance distribution associated with laser (including HEL) and relay target engagements via scaling law analysis/modeling of propagation and atmospheric beam control. The library has been designed for use in MATLAB, Python, or as a linked library within a compiled C++ executable. The library addresses airborne, tactical, ground-based, and maritime lasers working in direct attack mode or employed with high-altitude or space-based optical relay mirror systems. The library can handle an arbitrary number of relay platforms in the path to the target, and allows full variability of system parameters, atmospheric models, engagement geometries, and incorporation of arbitrary propagation and beam control effects. The principal output of the toolbox is a collection of beam metrics from which irradiance on target and its properties may be quantified.

Cost: $1500 per attendee

Venue: Online via Teams (hosted by DEPS)

Schedule: 10:00 – 18:00 Eastern Time each day

Registration: Credit Card Payment via MZA SHaRE Training – Pay Now

Training Objectives:
- Introduce analysist to a common understanding of laser system modeling and simulation
- Introduce the modeling techniques applied to laser systems
- Develop familiarity with following tools set:
  - o ATMTools toolbox in MATLAB
  - o SHaRE toolbox in MATLAB
  - o SHaRE toolbox in Python
  - o SHaRE toolbox API
- Provide illustrative examples of how modeling approaches are selected for given applications
- Illustrate the application of these approaches to airborne, ground based, and maritime systems
